

Exploring the Elevation in Mortality among People with HIV in the Era of Effective Therapy

Dr. Jessie Edwards

Department of Epidemiology
Gillings School of Global Public Health
UNC Chapel Hill.

Understanding advances in the care and treatment of adults with HIV and gaps in clinical care requires monitoring differences in mortality between people entering care for HIV and the general population. We combine HIV cohort data with vital statistics information for the general US population to compare mortality for people living with HIV over the 5 years after entry into HIV care with their expected mortality, had they been subject to the same covariate-conditional mortality risks as the general US population. We also examine whether this elevation in mortality would persist under a strategy to provide universal early treatment with antiretroviral therapy.
